Jürgen Renn’s research concerns the long-term developments of knowledge in consideration of processes of globalization and the historical dynamics that led to the Anthropocene. In over two decades at the MPIWG, his numerous research projects in knowledge development in relation to different cultures and historical periods have opened up new approaches, especially in the digital humanities. His central research topics include the origins of science in Europe and China, and the development of mechanics from antiquity to the twentieth century, including knowledge exchanges between Arabic and Latin language areas as well as between Europe and China in the early modern period. Additional research interests include the history of architectural knowledge and the history of modern physics, particularly the theory of relativity and quantum theory. On the basis of this research, a theory of knowledge evolution has emerged that incorporates cognitive dynamics as well as social contexts. Jürgen Renn has promoted the communication of scientific knowledge through a multitude of exhibitions, newspaper articles, television reports, and interviews and is deeply engaged in sustainability discussions at the intersection of science and politics.
